1 Machine Learning in Python - Project 2

Due Friday, April 12th by 4 pm.

Include contributors names in notebook metadata or here

1.1 Setup

Install any packages here and load data

```
[142]: # Add any additional libraries or submodules below
       # Data libraries
       import pandas as pd
       import numpy as np
       # Plotting libraries
       import matplotlib.pyplot as plt
       import seaborn as sns
       # Plotting defaults
       plt.rcParams['figure.figsize'] = (8,5)
       plt.rcParams['figure.dpi'] = 80
       # sklearn modules
       import sklearn

2 Introduction

This section should include a brief introduction to the task and the data (assume this is a report you are delivering to a professional body (e.g. FreddiMac company or similar company). If you use any additional data sources, you should introduce them here and discuss why they were included.

Briefly outline the approaches being used and the conclusions that you are able to draw.

3 Exploratory Data Analysis and Feature Engineering

Include a detailed discussion of the data with a particular emphasis on the features of the data that are relevant for the subsequent modeling. Including visualizations of the data is strongly encouraged - all code and plots must also be described in the write up. Think carefully about whether each plot needs to be included in your final draft - your report should include figures but they should be as focused and impactful as possible.

You should also split your data into training and testing sets, ideally before you look to much into the features and relationships with the target

Additionally, this section should also implement and describe any preprocessing / feature engineering of the data. Specifically, this should be any code that you use to generate new columns in the data frame **a**. Feature engineering that will be performed as part of an sklearn pipeline can be mentioned here but should be implemented in the following section.

If you decide to extract additional features from the full data (easyshare_all.csv), describe these variables here.

All code and figures should be accompanied by text that provides an overview / context to what is being done or presented.

variable summary

Numerical variable fico (credit score);

Categorical variable dt_first_pi (date of the first mortgage payment), it's a 6-digit number with format YYYYMM. From year 2017 to 2019.

Categorical variable dt_matr (maturity date, date of the last mortgage payment), it's a 6-digit number with format YYYYMM. From 202504 to 204812.

Binary variable flag_fthb (first time homebuyer), with missing value encoded with 9.

Numerical variable orig_upb (loan amount that has not yet been paid off);

Numerical variable int_rt (interest rate of the loan);

Identifier cd_msa, they are 5-digit codes of Metropolitan Statistical Area (MSA) regions in the US, where the complete list of encodings can be found in this document.

Categorical variable mi_pct (percentage of the loan amount that's required for mortgage insurance. It is often required when the borrower's down payment on a home is less than a certain percentage of the home's purchase price.) It's classified as categorical because only there's only 7 insurance levels: 0.6,12,20,25,30,35.

Categorical variable cnt units (number of units in the morgaged property), 4 levels: 1,2,3,4.

Categorical variable occpy_sts (mortgage type), 3 levels: owner occupied (P), second home (S), or investment property (I).

Numerical variable cltv (rate of loan amount to total property value, e.g. 90%) SAME AS ltv;

Numerical variable dti (debt-to-income ratio, which is calculated by monthly housing expenses that incorporate the mortgage payment, divided by the monthly income used to underwrite the loan);

Numerical variable 1tv (loan-to-value). For example, if a borrower takes out a mortgage for £150,000 to purchase a home that is appraised at £200,000, the original loan-to-value ratio would be $\frac{150,000}{200,000} = 0.75$, or 75%. This means that the borrower is financing 75% of the property's value with the mortgage loan, and the remaining 25% is covered by the borrower's down payment or equity.

Numerical variable int_rt (interest rate of the property);

Categorical variable channel;

Binary variable ppmt_pnlty, with Yes or No (penalty applied). A prepayment penalty is a fee charged by lenders if the borrower pays off the mortgage loan before the agreed-upon term. Note there's no Y instance in this dataset.

Binary variable prod type only fixed-rate mortgage in this dataset.

Categorical variable st (US states) two-letter abbreviations;

Categorical variable prop_type, property type: condominium (CO), planned unit development (PU), cooperative share (CP), manufactured home (MH), or Single-Family home (SF).

Identifier zipcode, they are 5-digit codes in the form of ###00;

Identifier id loan, unique ID for each entry;

Categorical variable loan_purpose, Cash-out Refinance mortgage (C), No Cash-out Refinance mortgage (N), Refinance mortgage not specified (R), or a Purchase mortgage (P);

Numerical variable orig_loan_term, number of monthly payments from first payment until maturity date.

Binary variable cnt_borr , the number of borrower(s) who're obligated to pay the mortgage. 1 = one borrower, 2 = more than one borrower.

Categorical variable seller_name, list of names of seller of mortgages.

Categorical variable servicer name, list of names of servicer of mortgages.

Binary variable flag_sc, all entries either have Y or NaN.

Binary variable default, our response variable, 1=default, 0=no default.

Missing value analysis

```
There is 1 missing value for fico (credit score);

3468 NA values for flag_fthb (binary, first time homebuyer);

594 null values for cd_msa (metropolitan statistical area), indicating 594 mortgaged properties are either not in a Metropolitan Area or MSA status unknown;

1 NA for cltv;

1 NA for dti, indicating 1 impossible value of > 65%;
```

1 NA for ltv;

38 missing values for ppmt_pnlty,

5751 missing values for flag_sc.

```

Feature Engineering

flag fthb replace all 9s with NaN and map Y as 1, N as 0.

cnt_units One-hot encoding 4 levels: 1,2,3,4.

occpy_sts One-hot encoding 3 levels: P,S,I.

cltv, dti,ltv discard 1 NA.

channel One-hot encoding 4 levels: R,B,C,T.

ppmy pnlty discard all NaN, map Y as 1, N as 0. Note there's no Y in this dataset.

prod_type discard this feature, all observations are "FRM" (fixed-rate mortgage). Have no predictive power to adjustable-rate mortgage.

prop_type One-hot encoding to 5 levels: 'SF' 'PU' 'MH' 'CO' 'CP'.

loan purpose One-hot encoding to 4 levels: C,N,R,P.

 $cnt_bnrr Map 1(1 borrower) to 0 and 2(> 1 borrower) to 1.$

flag_sc discard this feature, all observations are either Y or NaN. Have no predictive power.

4 Model Fitting and Tuning

In this section you should detail your choice of model and describe the process used to refine and fit that model. You are strongly encouraged to explore many different modeling methods (e.g. linear regression, interaction terms, lasso, etc.) but you should not include a detailed narrative of all of these attempts. At most this section should mention the methods explored and why they were rejected - most of your effort should go into describing the model you are using and your process for tuning and validating it.

For example if you considered a linear regression model, a polynomial regression, and a lasso model and ultimately settled on the linear regression approach then you should mention that other two approaches were tried but do not include any of the code or any in depth discussion of these models beyond why they were rejected. This section should then detail is the development of the linear

regression model in terms of features used, interactions considered, and any additional tuning and validation which ultimately led to your final model.

This section should also include the full implementation of your final model, including all necessary validation. As with figures, any included code must also be addressed in the text of the document.

Finally, you should also provide comparison of your model with baseline model(s) on the test data but only briefly describe the baseline model(s) considered
